My Script - Bowen

Date: _____

> This is **version 1** of our script. We will keep making it better as we go, but it is important to **practice now** so you know your part well.

Part 1 — Practice My Part

Create

How can a tiny computer feel a bug chewing inside a tree?

ArborListen has two parts: a vibration sensor and an M5Stack. We programmed our sensor to detect the frequency of the vibrations that EAB larvae make. The M5Stack reads the signal, and its screen shows the tree's stats and the vibrations. Let me demo it. First, I press the "Ready" button. Now watch the screen when I scratch the wood. *(Scratch the wood. Point to the screen.)* The screen shows the vibration! A scratch is not a real larva, but it shows that our sensor can feel tiny vibrations in wood.

Next, Jonathan will tell you how we tested it and made it better.

Please practice your part out loud 3 times. Tick one box each time you practice.

Part 2 — Design My Foam Board

> Each team member will hold up a **foam board** to help with our Robot Design presentation. This week, think about what you want to put on yours, then **draw a design**. You don't have to write a lot. Bring your design to our next meeting.

Ideas for what could go on your foam board:

- My mission name and points
- A drawing of my attachment
- A photo of the robot
- What my attachment does
- A problem we fixed
- Your own idea

1. Draw your design for your foam board.

Hint: Pretend the box is your foam board. Where do the title, pictures and words go? Boxes and labels are enough.
