My Script - Jason

Date: _____

> This is **version 1** of our script. We will keep making it better as we go, but it is important to **practice now** so you know your part well.

Part 1 — Practice My Part

Design

What if we could find the EAB early, before the ash trees die?

We compared three ideas: a camera, a microphone, and a vibration sensor. The larvae live under the bark, so a camera can't see them, and a microphone can't hear them. But when they chew under the bark, they make tiny vibrations in the wood. So we chose a piezoelectric sensor, which turns tiny vibrations into an electric signal. With it, we designed ArborListen to feel what we can't see or hear. From our sketches, we have a sensor that touches the bark, and an M5Stack that reads the signal and shows it on the screen.

Next, Bowen will tell you how our team created the solution.

Please practice your part out loud 3 times. Tick one box each time you practice.

Part 2 — Design My Foam Board

> Each team member will hold up a **foam board** to help with our Robot Design presentation. This week, think about what you want to put on yours, then **draw a design**. You don't have to write a lot. Bring your design to our next meeting.

Ideas for what could go on your foam board:

- My mission name and points
- A drawing of my attachment
- A photo of the robot
- What my attachment does
- A problem we fixed
- Your own idea

1. Draw your design for your foam board.

Hint: Pretend the box is your foam board. Where do the title, pictures and words go? Boxes and labels are enough.
