My Script - Jonathan

Date: _____

> This is **version 1** of our script. We will keep making it better as we go, but it is important to **practice now** so you know your part well.

Part 1 — Practice My Part

Iterate

(Show the video.) I ride my bike at Bruce's Mill Conservation Area. An ash tree there was infested with EAB and had to be cut down.

Our first version was a flat vibration sensor that sat on the bark. One problem we found is that it might not detect the larvae, because they are too small and the bark might be too thick. If it misses them, the ash tree might already be dead before we detect any sound. So for our second version, we added a needle to go deeper into the tree's bark, and we upgraded the sensor's sensitivity. We also searched for the hertz of the EAB larvae, so we can set the sensor to that exact hertz. For our next iteration, we plan to put a waterproof cover on the sensor.

Next, Jasper will talk about how we connected with experts.

Please practice your part out loud 3 times. Tick one box each time you practice.

Part 2 — Design My Foam Board

> Each team member will hold up a **foam board** to help with our Robot Design presentation. This week, think about what you want to put on yours, then **draw a design**. You don't have to write a lot. Bring your design to our next meeting.

Ideas for what could go on your foam board:

- My mission name and points
- A drawing of my attachment
- A photo of the robot
- What my attachment does
- A problem we fixed
- Your own idea

1. Draw your design for your foam board.

Hint: Pretend the box is your foam board. Where do the title, pictures and words go? Boxes and labels are enough.
