Jonathan - Iterate

Your part: Explain how we find problems, make changes, and check whether they help.

Write 2-3 short bullet points per question in your own words. Use real team examples.

1. **What is one difficulty we found while testing the sensor or searching for ash trees?**
   Think back: What noises did the sensor pick up at the park? Did we find an ash tree for sure?

2. **What change did we make, or could we try, to address that difficulty?**
   Think back: How could we hold the sensor better, or change the trigger level in the code?

3. **How could we check fairly whether that change makes our prototype better?**
   Think back: If we repeat the same scratch many times, what would we count each time?

FUTURE PLAN

4. **What is the next improvement we plan to make, and how will we know it worked?**
   Think back: What still fools our sensor? What will keep it dry and safe on a real tree?
