

Code Vault Mission

Week 3 | September 26, 2026

Detective Name: _____ GitHub Username: _____

What We Learned in Class

GitHub is our online “vault” where we save code, notes and ideas so everyone can see them and nothing gets lost. A **repository (repo)** is our team’s project folder. A **commit** saves your work with a short note about what you changed.

Part 1 Put Your First File in the Team Vault

With a parent, upload **one file (anything you like!)** into our team folder: **week03_gitupload/**.

Ideas: a photo of your Week 1 animal sketch, your robot or LEGO build, or a text file saying hi to the team.

File name rule: Start your file name with your **first name** so nobody overwrites anyone else’s file. Example: **Hugh's_robot_sketch.jpg**

Upload Checklist

- ☐ **1. Sign in to GitHub** and go to **github.com/joyrobots/2026_bioglow_excavators**.
Open **week03_gitupload**.
- ☐ **2. Click Add file**, then **Upload files** (top right, next to the green **Code** button).
- ☐ **3. Drag your file** into the box, or click **choose your files**.
- ☐ **4. In Commit changes**, write a short note.
Example: **Add Hugh's robot sketch**
- ☐ **5. Click the green Commit changes** button.
- ☐ **6. Go back to week03_gitupload**. Check that you can see your file.

My uploaded file name: _____

Design Your Salamander Sensor

Part 2 | Plan, draw and label your idea

In class we explored the **M5Stack**, a tiny computer with a screen that can read sensors. The Jefferson Salamanders on Stouffville Road cross through a tunnel (culvert) on rainy spring nights.

Your job: Design how an **M5Stack** and a **sensor** could spot them!

Which sensor did we explore in class?

Where would you put it?

Draw Your Design

Show the **tunnel**, a **salamander**, your **M5Stack** and your **sensor**. Label each part.
